V
Mycetes 1840, 29 Oct.
Larch 1891, 22 Min.

Aspergillus larchae - Larch - the mycelium occurs on the surface of the wood

and on living wood and they form an irregular brownish colony of soft texture, the surface slightly
irregular and creviced and the surface granular (the colonies in the tree most often appear on the
dead wood) - the surface appearing yellowish or tan colored, with white or cream colored areas
of dead tissue interspersed. The colonies have a strong odor similar to that of old
timber or wood smoke. They are not easily seen, ~~as~~ ^{but} by the naked eye. The colonies are
soft and spongy and on the wood there are also numerous small whitish or off-white spots which
are often scattered over the surface. These spots are not always of a uniform
size and coloration and some are larger than others. Some are so large as to suggest a single
colonies and others are so small as to suggest many small colonies. The colonies are
soft and spongy and the surface is irregular. The colonies are also very soft and easily
broken up or torn apart. The colonies are also very soft and easily broken up or torn apart.
The colonies are also very soft and easily broken up or torn apart.
